

Description

Owner and renowned green roof consultant, Ed Snodgrass, created this specific mix of plants to meet the LEED requirements for native plants on a green roof. The mix has a functional base of ground cover plants, combined with 30% native accents plants. Our North American Native blends are available for each of our regional mixes (Northeast, Mid-Atlantic, Southeast, Midwestern, etc.).

The species included in our mixed flats are chosen to work well in a wide variety of environmental conditions typically found on green roofs. The plants in our native mixes accommodate an environment that changes season-to-season and year-to-year, adapting to a wide range of light, temperature, and other cultural conditions. Plants provide a good food source for pollinators and birds.
