

# Plants from Emory Knoll Farms

Emory Knoll Farms was the first nursery in the U.S dedicated solely to the propagation of plants for the green roof industry. Our selection of plants is the end product of many years of solid experience, both in greenhouses and on green roofs.

Our plants are grown as deep-rooted 3" plugs, a size that offers the most benefits for immediate establishment and long-term plant health on a green roof. The media in which we grow our plants is intentionally designed for green roof applications. It is mapped to the air filled porosity in green roof growing media, so our plugs will integrate faster and become established more rapidly once on the roof.

In addition to selling individual species, we offer mixed flats of plants designed for each of the following regions: **Mid-Atlantic**, **Northeast**, **Mid-West**, **Southeast**, as well as **Pollinator Friendly**, **30% Native** and **Leafy Green** mixed flats.

All plugs arrive on-site in optimal condition as strong and healthy plants, and do not need to be supplemented with fertilizer to maximize their growth during the first year. The plant species we keep in our inventory are those that we have seen proven on green roofs, both on our own research roofs and over time on real world projects.
